

# Broadcast Storm Problem

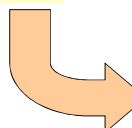

CSE6811: Dr. Ashikur Rahman 1

## Broadcasting Approaches

Approach

**Reliable:**

- Guaranteed to reach all nodes.
- Usually require  $\geq 1$  hop info

**Unreliable:**

- No guarantee to reach all
- Best Effort service
- Usually requires no topology information

CSE6811: Dr. Ashikur Rahman 2

## First paper on Broadcasting

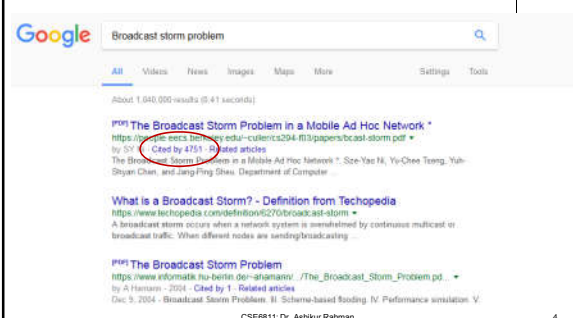

“The Broadcast Storm Problem in a Mobile Ad hoc Network”

Discusses problem if we broadcast with ZERO-topology knowledge (flooding) and possible remedies

## Storm in Internet

Subject: Hold on! Don't throw out this message yet!  
 Date: Wed, 30 Jun 1999 07:35:40 +0800 (CST)  
 From: Rory.Bellows@chu.edu.tw  
 To: you@chu.edu.tw

Dear Sir or Madam,

Allright, I'm not going to give you any bull. This is "junk" mail, but if you will please just give me 60 seconds of your time and read the next paragraph, maybe I can change your mind. Just 60 seconds. What have you got to lose?

Below is a message I got last month. I said "junk," and was dragging the icon to my trash can when I figured "what the hell," and began reading it. I ALWAYS throw stuff like this out. But I read. And now I'm rolling in \$\$\$\$. This works and I'm not kidding. At first it sounds like your typical "pyramid scheme" scam, but it's not - the difference is that you're actually selling a product! I won't go into the details right now, if you're interested you can keep reading the rest of the message. I just want to say a couple things: First, don't take my word for it that this works. Use your own head. Just read this message and think about the process logically. You'll see that it won't fail! Second, just make sure you follow the instructions TO THE LETTER. I can't stress that enough. ...

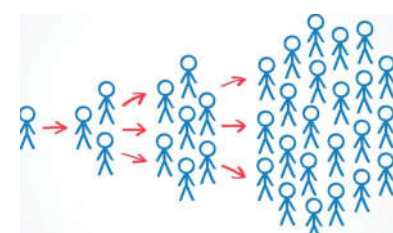

JUST DO IT!! Yeah, it's a long message to read, but it's worth it!

Thanks,  
 Rory

## Storm in FB

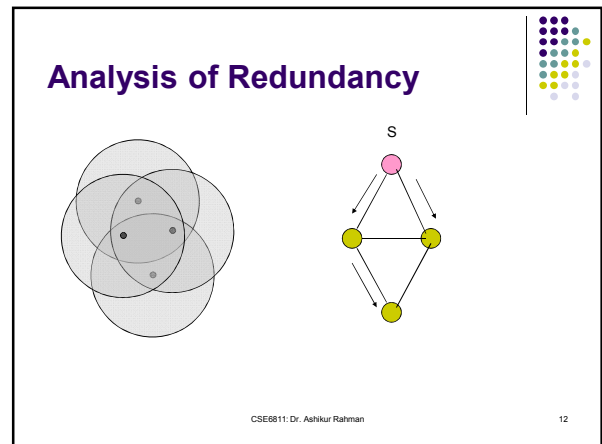

CSE6811: Dr. Ashikur Rahman 6

### Broadcast Storm

Redundancy + Contention + Collision = Broadcast Storm

CSE6811: Dr. Ashikur Rahman 11

### Analysis of Redundancy

The diagram shows a Venn diagram on the left with four overlapping circles, each containing a dot. To its right is a network diagram with a source node 'S' (pink) at the top and seven destination nodes (yellow) arranged in a diamond shape. Arrows indicate connections from 'S' to the top two nodes, and from those nodes to the middle two nodes, and so on, eventually reaching the bottom node.

CSE6811: Dr. Ashikur Rahman 13

### Analysis of Redundancy

Two network diagrams are shown. The left one has a source 'S' (pink) connected to two nodes, which are connected to two more nodes, and finally to one node. Below it is the text "4 vs. 2". The right one has a source 'S' (pink) connected to two nodes, which are connected to three nodes, which are connected to two nodes, and finally to one node. Below it is the text "7 vs. 2".

CSE6811: Dr. Ashikur Rahman 14

### How to Mathematically quantify Redundancy?

- We can figure out minimum number of forwarding needed to complete a broadcast
  - Anything extra is redundant
  - Problem:
    - Depends on node density
    - Finding minimum number of forwarding: hardest part

Solution:  
Try to quantify in terms of coverage area

CSE6811: Dr. Ashikur Rahman 15

### Concept of Additional Coverage

A Venn diagram with two overlapping circles, A and B. The intersection is shaded pink. A red arrow points to the non-overlapping part of circle B, labeled "Additional Coverage". To the right, a box labeled "Additional Coverage" has three sub-boxes: "Min", "Max", and "Average".

CSE6811: Dr. Ashikur Rahman 16

### Concept of Additional Coverage

A Venn diagram with two overlapping circles, A and B. The intersection is shaded pink. The non-overlapping parts are shaded light orange and light purple.

CSE6811: Dr. Ashikur Rahman 17

### Concept of Additional Coverage

A single circle containing two points, A and B. The circle is shaded light orange.

CSE6811: Dr. Ashikur Rahman 18

### Additional Coverage (Max)

$$\int_{r/2}^r \sqrt{r^2 - x^2} dx$$

CSE6811: Dr. Ashikur Rahman 19

### Additional Coverage (Max)

$$\int_{r/2}^r \sqrt{r^2 - x^2} dx$$

$$x = r \sin \theta$$

$$dx = r \cos \theta d\theta$$

$$x = r \Rightarrow \theta = \frac{\pi}{2}$$

$$x = r/2 \Rightarrow \theta = \frac{\pi}{6}$$

CSE6811: Dr. Ashikur Rahman 20

### Additional Coverage (Max)

$$4 \times \int_{\pi/6}^{\pi/2} (\sqrt{r^2 - r^2 \sin^2 \theta}) r \cos \theta d\theta$$

$$= 4 \times r^2 \int_{\pi/6}^{\pi/2} (\cos^2 \theta) d\theta$$

$$= r^2 \left[ \frac{2\pi}{3} - \frac{\sqrt{3}}{2} \right]$$

$$= 0.39\pi r^2$$

CSE6811: Dr. Ashikur Rahman 21

### Additional Coverage (Max)

$$0.39\pi r^2$$

$$\pi r^2 - 0.39\pi r^2 = 0.61\pi r^2$$

CSE6811: Dr. Ashikur Rahman 22

### Additional Coverage (Average)

Average:  
= total additional coverage/ total nodes  
=  $0.61\pi r^2$

CSE6811: Dr. Ashikur Rahman 23

### Generalized

Average additional coverage =  $\frac{\text{Additional Coverage for all nodes within TX range of A}}{\text{Total number of nodes within TX range of A}}$

- $\mu$  node density (NODES/METER<sup>2</sup>)
- total nodes =  $\pi r^2 \times \mu$

CSE6811: Dr. Ashikur Rahman 24

### Additional Coverage of All nodes?

CSE6811: Dr. Ashikur Rahman 25

### Additional Coverage of All nodes?

- Additional Coverage for all nodes located at distance  $x$ ,  
 $= A.C.(x) \times \text{Number of nodes at distance } x$

CSE6811: Dr. Ashikur Rahman 26

### Number of nodes at distance $x$

- $\mu$  node density

Number of nodes at distance  $x$   
 $= \text{Area of strip} \times \text{Node density}$   
 $= 2\pi x dx \mu$

CSE6811: Dr. Ashikur Rahman 27

### Average

- Additional Coverage for all nodes located at distance  $x$ ,  
 $= A.C.(x) \times \text{Number of nodes at distance } x$   
 $= 2\pi \mu x \times A.C.(x) dx$
- $x$  can vary from 0 to  $r$
- Additional Coverage for all nodes within TX range of A,  
 $\int_0^r 2\pi \mu x \times A.C.(x) dx$

CSE6811: Dr. Ashikur Rahman 28

### Average

Average = (Additional Coverage for all nodes within TX of A) / Total number of nodes

$$\frac{\int_0^r 2\pi \mu x \times A.C.(x) dx}{\pi \mu r^2} = 0.41\pi r^2$$

CSE6811: Dr. Ashikur Rahman 29

### Summary of additional Coverage by a single node

Min = 0

Max =  $0.61\pi r^2 = 61\%$

Average =  $0.41\pi r^2 = 41\%$

CSE6811: Dr. Ashikur Rahman 30

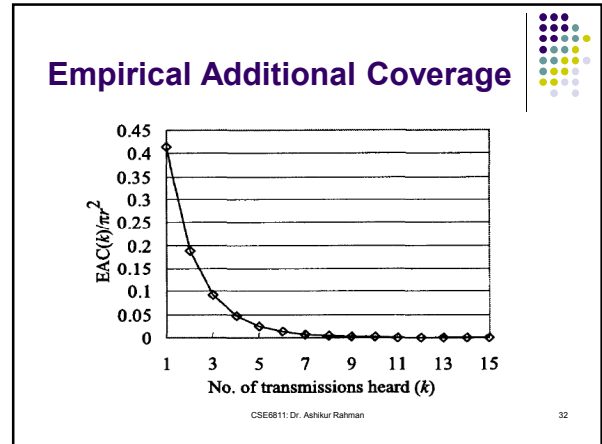

### Situation becomes worse when coverage overlaps

Less Additional Coverage

Good Additional Coverage

Overlapping Additional Coverage

CSE6811: Dr. Ashikur Rahman 31

### Analysis of Contention

- When a host broadcasts, its neighbors are likely to contend with each other for the medium.
  - A ⇒ B, C, D
  - B, C, D could seriously contend with each other.

CSE6811: Dr. Ashikur Rahman 33

### Probability of Contention

C contends with B

'C' does not contend with B

CSE6811: Dr. Ashikur Rahman 34

### Probability of Contention

$$P(x) = \frac{S_{A \cap B}}{\pi r^2} = \frac{INTC(x)}{\pi r^2}$$

CSE6811: Dr. Ashikur Rahman 35

### Average Contention

Probability of contention for all B located at distance  $x = 2\pi x \times P(x) \times dx$

Average,

$$\frac{\int_0^r 2\pi x \times P(x) dx}{\pi r^2} = 59\%$$

CSE6811: Dr. Ashikur Rahman 36

### More nodes more contention

- $cf(n, k)$ : The probabilities of having  $k$  contention-free hosts among  $n$  receiving hosts.

CSE6811: Dr. Ashikur Rahman 37

### Analysis of Collision

- Higher Possibility of Collision:
  - Rebroadcasts are likely to start at the same time.
  - lack of RTS/CTS dialogues
  - lack of collision detection (CD) if collision occurs
  - hidden terminal problem

CSE6811: Dr. Ashikur Rahman 38

### Solution to Broadcast storm?

- Reduce contention and collision:
  - Include randomness
- Reduce Redundancy:
  - Inhibit some nodes from re-broadcasting
  - Do it intelligently

CSE6811: Dr. Ashikur Rahman 39

### Generic Algorithm

CSE6811: Dr. Ashikur Rahman 40

### How to determine worthiness?

- Reduce Broadcast Storm
  - Probabilistic scheme
  - Counter based scheme
  - Distance based scheme
  - Location based scheme
  - Cluster based scheme

CSE6811: Dr. Ashikur Rahman 41

### Probabilistic scheme

- Rebroadcast by "Tossing a Die"
- A host always rebroadcasts with a certain probability  $P$ .
- Let  $P = 80\%$ 
  - Generate a Random number between 1 to 100, broadcast if the generated number is less than 80

- When  $P = 1$ , this is flooding.
- A smaller  $P$  will reduce the storm effect.

CSE6811: Dr. Ashikur Rahman 42

### Counter based scheme

Node A has heard the same message 3 times before forwarding, little additional coverage

$$A.C.(x) \propto \frac{1}{k}$$

CSE6811: Dr. Ashikur Rahman 43

### Counter based scheme (continue)

- If a host has received the same broadcast packet more than C times,
  - then do not rebroadcast.
- Additional Coverage
  - 1 time => 41%
  - 2 times => 19%
  - 3 times => 9%
  - 4 times => 5%
  - > 4 times, very little extra area

No. of transmissions heard (k)	Additional Coverage (%)
1	41%
2	19%
3	9%
4	5%
> 4	very little

CSE6811: Dr. Ashikur Rahman 44

### Distance based scheme

For closely located two nodes there is a marginal difference in their coverage area

CSE6811: Dr. Ashikur Rahman 45

### Distance based scheme

- Calculate the distance to the sending host.
- $d_{min} = \text{Min}\{ \text{the distance to each sending host} \}$
- If  $d_{min} < D$  (a threshold), then do not rebroadcast.
- How to find distance:
  - signal strength
  - GPS devices

CSE6811: Dr. Ashikur Rahman 46

### Location based scheme

- From GPS to obtain the sender's location.
- Let  $(x_1, y_1), (x_2, y_2), (x_3, y_3), \dots, (x_k, y_k)$  be locations of senders.
  - We can accurately calculate the additional coverage.

No Extra Coverage

Some Coverage

CSE6811: Dr. Ashikur Rahman 47

### Difficult computation

- Involve complicated math to calculate the extra coverage.
  - A lot of calculus!
- Approximation:
  - grid simulation

CSE6811: Dr. Ashikur Rahman 48

### Modified location based scheme

- Polygon Test:
  - If a node is within the polygon formed by the locations of senders, then DO NOT rebroadcast. (Fig. (a))
  - Otherwise, rebroadcast. (Fig. (b))
  - If a host is within the convex, the maximum additional coverage is well below 22%.

CSE6811: Dr. Ashikur Rahman 49

### Modified location based scheme

CSE6811: Dr. Ashikur Rahman 50

### Cluster based scheme

Figure 6: An example of a clustered MANET. Clustering provides a host the connectivity information of its surroundings.

CSE6811: Dr. Ashikur Rahman 51

### Simulation parameters

- no of hosts = 100
- transmission radius = 500 meters
- packet size = 280 bytes
- transmission rate = 1 M bits/sec
- broadcast arrival rate: 1 per sec. to the whole map
  - 1x1, 3x3, 5x5, 7x7, 10x10
- IEEE 802.11 without PCF (point coordination function)

CSE6811: Dr. Ashikur Rahman 52

### Performance metrics

- Reachability = % of nodes receiving the broadcast.
- Latency = time to complete a broadcast
- Saved Rebroadcast =  $(r - t)/r$ 
  - $r$  = number of nodes receiving the broadcast.
  - $t$  = number of nodes that rebroadcast

CSE6811: Dr. Ashikur Rahman 53

### Probability based

- We vary  $P = 0.2, 0.3, \dots, 1$  to observe the performance.
- A larger  $P$  means more rebroadcast.

CSE6811: Dr. Ashikur Rahman 54

### Observation

- Reachability:
  - In smaller maps, a low P is sufficient to achieve high reachability.
  - A larger P is needed in a larger map.
- Saved Rebroadcast:
  - linear with respect to P
- Latency:
  - Interestingly, in smaller areas, broadcast tends to complete in a slower speed. (due to higher node density)

CSE6811: Dr. Ashikur Rahman 55

### Counter based

- We vary  $C = 2, 3, \dots, 6$  to observe the performance.
  - A larger C means more rebroadcast.

CSE6811: Dr. Ashikur Rahman 56

### Distance Based scheme

- We vary  $D = 147, 72, 37, 20, 11$  to observe the effect.
  - Smaller D means more rebroadcasting.

CSE6811: Dr. Ashikur Rahman 57

### Observation

- Why choosing  $D=147$ ?
  - addition coverage = 0.187, equal to that of  $C=2$
- Reachability:
  - All look good, close to flooding.
- Saved Rebradcast:
  - not much
- Latency:
  - smaller area has higher latency

CSE6811: Dr. Ashikur Rahman 58

### Location based scheme

- We vary A (addition coverage) from 0.1 to 0.01.
  - Smaller A means more rebroadcast.

CSE6811: Dr. Ashikur Rahman 59

### Observation

- Why choosing  $A=0.187$ ?
  - This is additional coverage offered by  $C=2$ .
- Best performance over all the above schemes!

CSE6811: Dr. Ashikur Rahman 60

## Drawbacks

- Best effort service
  - A miss may cause a significant portion of the network unreachable.
- Sensitive to threshold values
  - Sparse networks require more rebroadcast (high threshold value)
  - Dense networks require less rebroadcast (low threshold value)
  - How to choose appropriate threshold value????  
(no hope)

CSE6811: Dr. Ashikur Rahman

61

## Extra

$$INTC(d) = 4 \times \int_{d/2}^r \sqrt{r^2 - x^2} dx$$

$$AC(d) = \pi r^2 - INTC(d)$$

$$= \pi r^2 - 4 \times \int_{d/2}^r \sqrt{r^2 - x^2} dx$$

CSE6811: Dr. Ashikur Rahman
